# **CMPT 225 D100, Spring 2023**

## Midterm Exam March 10, 2023

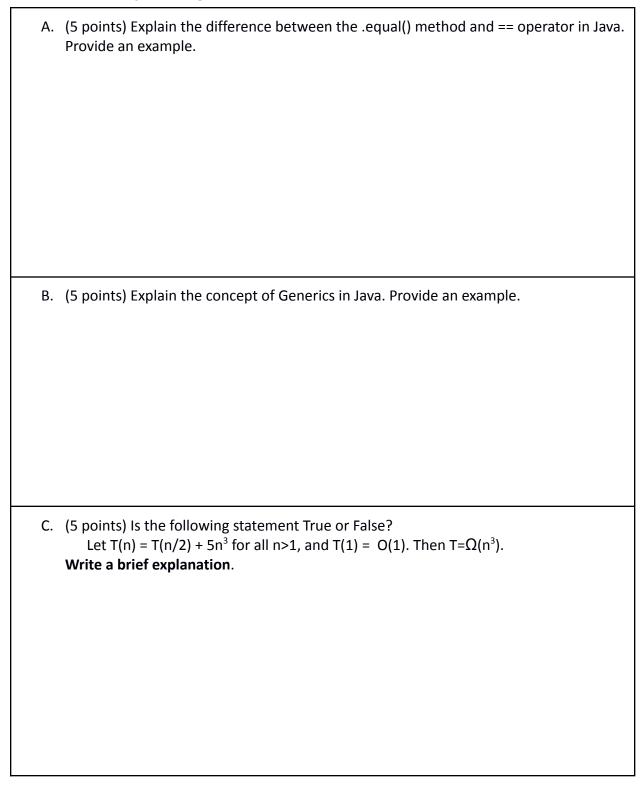

Name		
SFU ID:   _ _ _	_	
	Problem 1	
	Problem 2	
	Problem 3	
	Problem 4	
	TOTAL	

#### Instructions:

- 1. Duration of the exam is 100 minutes.
- 2. Write your full name and SFU ID \*\*clearly\*\*.
- 3. This is a closed book exam, no calculators, cell phones, or any other material.
- 4. The exam consists of four (4) problems, each worth 25 points
- 5. Write your answers in the provided space.
- 6. There is an extra page at the end of the exam. You may use it if needed.
- 7. Explain all your answers.
- 8. Really, explain all your answers.

Good luck!

### Problem 1 (Java syntax, Big-O notation) [25 points]

D. (5 points) What is the running time of bar() on an array of length n? **Explain your answer.** 

E. (5 points) Prove that the running time of the function foo(n) below is O(n²).
public static int foo(int n) {
 if (n>=5)
 return foo(n/2)+foo(n/3)+foo(n/4)+foo(n/5);
 return 1;
}

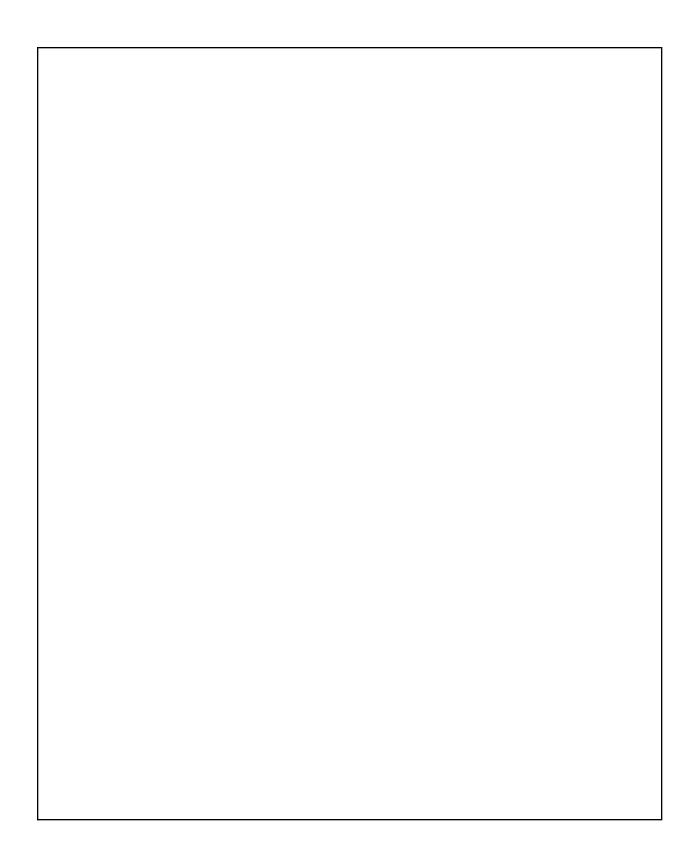

#### Problem 2 (Stack, Queues, Linked Lists) [25 points]

A. Write a generic class StackWithMin that supports the following operations, with running time O(1) for each operation.

```
public class StackWithMin
public StackWithMin
- a constructor
creates an empty stack
public void push(T item) - adds an element to the stack
public T pop() - removes an element from the stack
public int size() - returns the number of elements in the stack
public boolean isEmpty() - checks if the stack is empty
public T min() - returns the minimal element currently in the stack
The method does not modify the stack
Two elements are compared using the compareTo() method
Given a and b, we say a<b if a.compareTo(b)<0.</p>
```

Implementing correctly all methods except for min() is worth up to 15 points.

Before writing code, explain your answer.

#### Problem 3 (Binary Trees) [25 points]

In this problem use the following definition of Binary Tree. You may assume the classes have the standard getters/setters.

```
public class BTNode<T> {
    private T data;
    private BTNode<T> leftChild;
    private BTNode<T> rightChild;
    private BTNode<T> parent;
}

public class BinaryTree<T> {
    private BTNode<T> root;
}
```

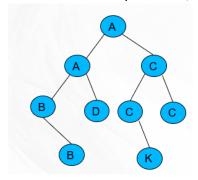

A. (10 pts) Write the method countNodesWithOneChild() for the class Binary Tree. The method returns the number of vertices in the tree with exactly one child.

Explain the idea of the algorithm and its running time.

```
public int countNodesWithOneChild() {
```

}

B. (10 pts) Write a method for the class Binary Tree that returns the number of vertices v in the tree such that v.data is equal to v.parent.data. Compare the data using equals() method. For example below, the function needs to return 4 (A,B and C x2)

Explain the idea of the algorithm and its running time.

```
public int countChildrenEqualToParent() {
```

}

C. (5 pts) Draw a Binary Tree whose inOrder sequence is [1,2,3,4,5,6,7,8] and postOrder is [2,1,4,6,5,3,8,7].

#### Problem 4 (Binary Search Trees) [25 points]

```
A. (10 points) Consider the class BinarySearchTree, defined as
   public class BinarySearchTree<T extends Comparable<T>>> {
          private BTNode<T> root;
   }
   Use the definition of BTNode from Problem 3.
   Write the method insert() for the class BinarySearchTree. It gets an item, adds it to the
   Binary Search Tree as a leaf, and returns the pointer to the new node.
   public BTNode<T> insert(T elt) {
   }
```

B. (5 points) Draw the AVL tree obtained by inserting the sequence [8, 3, 6, 10, 20, 15].	
<ul><li>C. (5 points each question) For each of the following statements, decide if it is True or False. Prove your answer.</li></ul>	
<ol> <li>Insertion into an AVL tree always increases the number of leaves.</li> </ol>	
2. There exists an AVL tree of height 4 with exactly 5 leaves.

#### **Master Theorem**

Let 
$$T(n) = a T(n/b) + f(n)$$
,  $T(1) = O(1)$ 

Define  $c = log_b(a)$ 

- If  $f(n) = O(n^d)$  for d<c, then  $T(n) = \Theta(n^c)$
- If  $f(n) = \Omega(n^d)$  for d>c, then  $T(n) = \Theta(n^d)$
- If  $f(n) = \Theta(n^c)$ , then  $T(n) = \Theta(n^c \log(n))$
